Circling at an altitude of about 50 km to the surface of the lunar satellite sends first data and images.

The task equipped with a complex system of communication and research satellites apparatus Lunar Reconnaissance Orbiter is collecting information through the creation of a detailed map of the lunar surface.

Satellites placed into orbit June 18 this year, followed by a period lasting 60 days trial, involving the preparation of calibration and equipment to operate.

For the first time satellites have collected such detailed data on the moon. The researchers hope to find in the Silver Globe various resources (eg water), make

measurements of temperature, radiation levels, as well as identify areas where future landers could land before the planned mission. According to Richard Vondrák, a scientist with NASA, through the mission will be to create a very accurate atlas of the lunar south pole, as well as pave the way for future lunar exploration by manned expedition.

As reported by NASA satellites have discovered that the Moon's south pole may be frozen water and hydrogen. If it turns out that the moon is enough ice, astronauts, who in the future you will land on the moon, will be extracted, rather than to import water from the earth.

Begin the mission by NASA shows the entry in the first phase of the project re-send manned expeditions to the moon, which took place in 2020. Given the current economic situation, however, these plans may change. According to representatives of NASA, the key factor in deciding on the manned mission to moon will be information that can be gathered about him.
